TABLE 9: PRODUCTIVITY GAINS ALLOW REAL GMP TO GROW FASTER THAN EMPLOYMENT	66

Note: All data in Tables 1-8 is reported in current (or nominal) US dollars. Nominal data does not rely on inflation estimates, making it a cleaner data set with which to do cross-geography (particularly international) comparisons. However, in Table 9, we compare growth in real gross product to employment. Employment is a real concept and should be compared to real GMP. Further, since metro area and state-level gross product are all deflated by a common national price deflator, showing this information in real terms would not change the relative ranking of the geographies.
